

# Demountable Mobile Hot Boxes

These Mobile Hot Boxes are available in various capacities to suit different sizes of vehicle. All our demountable units use our clean-burning, thermostatically-controlled gas heating system, and some come with dual compartments to store two different material types. A Mobile Hot Box will allow you to carry out small scale reinstatements with hot asphalt for a permanent, 'right first time' repair process.

Demountable Hot Boxes are designed for mounting on vehicles ranging from 7.5 up to 18 tonne GVW. Models holding 3.5 tonnes and above require a tipping chassis for mounting. We always recommend the tipping mechanism where possible, as it offers a fast yet controlled discharge method that has proved exceptionally popular with operatives over the years.

If tipping is not an option, some of the smaller units can be mounted on a flatbed truck if required, since they are short enough that the material can be easily and safely shoveled out. Another option is a self-tipping Box with integral tipping gear. This innovative model allows users to benefit from gravity discharge on a flatbed vehicle.

Various models of demountable Box are available to hire for periods as short as two weeks. They will all comfortably keep material hot overnight for use the following day, allowing you to use hot asphalt for night works or other times when the plant is closed.
