WARM BOX FOR COLD LAY

The Proteus 'Warm Box for Cold Lay' is an ideal way to keep cold lay material in useable condition all year round. This small portable container features thermostatically-controlled heating so that you can keep your cold lay at a warm, workable state no matter what the temperature is outside.

Despite the somewhat contradictory name, cold lay asphalt will not work optimally if it is stone cold. Not only will it be tough to manage at the rake, but it will also not easily bind to the surrounding asphalt nor to other materials such as manhole covers. The use of a Proteus Warm Box will ensure your cold lay material is pliable and binds properly to its surroundings.

Warm Boxes are available in various capacities to suit individual requirements and only require a small electric power source in order to operate, with customers able to choose between single and dual volt electrics. Using a Warm Box will also mean you no longer need to worry about the health & safety implications of transporting fumey cold lay material in the vehicle cab.

So if you prefer to stick to cold lay for small reinstatements, a Proteus Warm Box means never again will you have to struggle with tough, unworkable cold lay, saving you time and money.
